## - Lab 3: Getting Started with SQL Queries - 10 points

---

Goals	<ul style="list-style-type: none"><li>• Become accustomed to writing SQL queries.</li><li>• Enjoy the beauty and accuracy of the relational model.</li><li>• Get some still-easy lab points.</li></ul>
Before you begin	Check that your instance of our beloved CAP database is <b>exactly</b> the same as mine in the script on our class web site. You need to have a clean instance when you begin this assignment. If you've modified it in any manner, please drop everything in CAP and reload from the scripts on our class web page.
Instructions	<p>Use CAP to answer all of these query questions. Write only one query per question. Be certain to end each query with a semi-colon and to label each query with the question number in a comment. Your final script should execute all of the queries in sequence from one command. Remember that CAP is one snapshot in time in the life of that database, but the queries you write should return the correct answer for all time, not just for this snapshot.</p> <ol style="list-style-type: none"><li>1. List the order number and total dollars of all orders.</li><li>2. List the last name and home city of people whose prefix is "Ms."</li><li>3. List id, name, and quantity on hand of products with quantity more than 1007.</li><li>4. List the first name and home city of people born in the 1920s.</li><li>5. List the prefix and last name of people who are not "Mr."</li><li>6. List all fields for products in neither Dallas nor Duluth that cost US\$17 or less.</li><li>7. List all fields for orders in January of <b>any</b> year.</li><li>8. List all fields for orders in February of <b>any</b> year of US\$23,000 or more.</li><li>9. List all orders from the customer whose id is 007.</li><li>10. List all orders from the customer whose id is 005.</li></ol>
Advice	<p>Test, test, and test again. Then test some more. When you think you've tested enough, go back and keep testing. Then get someone else to test for you while you test theirs.</p> <p>Push your work to your GitHub repository early and often. While you're in there . . .</p> <ul style="list-style-type: none"><li>• Be sure to write meaningful commit messages.</li><li>• Practice using <i>diff</i> to see the differences between successive versions of your code.</li><li>• Practice reverting to an earlier version so that you'll have that option in the future.</li></ul> <p>Don't forget to test. A lot. Really. (Rilly.)</p>
Resources	<ul style="list-style-type: none"><li>• Chapter 6.1 in our text</li><li>• SQL tag at Stack Overflow - <a href="http://stackoverflow.com/questions/tagged/sql">http://stackoverflow.com/questions/tagged/sql</a></li></ul>
Submitting	Submit your work as a text file with a <i>.sql</i> extension. Push your work to your GitHub repository <b>before</b> the due date (see syllabus). Remember to include your name, the date, and the assignment in the (copious, meaningful, and accurate) comments in your code.
